Joint Mathematics Meeting 2014
Quantitative Literacy is:

- “the *habit of mind* to consider both the power and limitations of quantitative evidence in the evaluation, construction, and communication of arguments in public, professional, and personal life” (Grawe 2011).

- “*a predisposition* to look at the world through mathematical eyes, to see the benefits (and risks) of thinking quantitatively about commonplace issues, and to approach complex problems with confidence in the value of careful reasoning” (Steen 2001).

- *the power and habit of mind* to search out quantitative information, critique it, reflect upon it, and apply it in their public, personal and professional lives” from the vision of the National Numeracy Network as cited by Madison and Steen (2008).

- Etc...
Goal:

• Design a reasonable (small scale, manageable) assessment instrument to capture the idea that quantitative literacy encompasses more than just the ability to respond capably to specific prompts.

• Instead of measuring “can my students …”, measure “do my students …”

• Administered within an authentic context.
Measure whether our students have the inclination to:

- glean, identify and report quantitative information in direct support of a thesis statement;
- invoke quantitative reasoning to critique a statement or opinion;
- check numerical information presented in text with any accompanying graphics; and
- critically evaluate information presented graphically.
Design: Context

<500 word newspaper article containing:

• content of interest to college students.
• a variety of quantitative statements (including relative and absolute quantitative comparisons).
• An argument supported by quantitative comparisons.
• A graph which exhibits some discrepancies between the numerical information presented in the article.
• Quantitative strengths and weaknesses.
Design: Prompts

• Open-ended and not multiple choice.

• Do not explicitly refer to any quantitative or mathematical calculation.

• Short amount of space for student responses.
1. Did you understand the article? If not, what did you find confusing?

2. What was the main point(s) of the article?

3. What facts did the author use to support the main point(s)?

4. Were there any particular strengths or weaknesses in how these facts were reported?

5. Does the graph help interpret the numerical information found in the text? Explain your thoughts.

Used to assess our outcomes.
Scoring: Language and Reading

“1. Did you understand the Article?”
Used to help identify those students who may have difficulty with the language encountered in the reading.

“2. What was the main point(s) of the article?”
Measures a student’s ability to identify the main point of a lengthy article.

1/15/2014  boersmas@cwu.edu
Scoring: Habit of Mind to Seek out and Report Quantitative Information

3. What facts did the author use to support the main point(s)

1: Some relevant quantitative information is identified (or alluded to), but none is correct (or specific enough to be judged correct or incorrect).

2: Some relevant and correct information is identified, but not all.

3: All relevant quantitative information is correctly identified.
4. Were there any particular strengths or weaknesses in how these facts were reported?

Measures whether or not students focus on quantitative strengths or weaknesses. For this item students needed to 1) draw a conclusion (are there any strengths or weaknesses present in the article?) and 2) base their conclusion with correct and complete quantitative analysis.

Scoring: Habit of Mind to Seek out and Report Quantitative Information

0: No strength or weakness identified or, if identified, not supported with quantitative reasoning.

1: A strength or weakness is identified but is supported with incorrect quantitative reasoning (or the reasoning is not specific enough to be able to judge correctness).

2: A strength or weakness is identified and is supported with quantitative reasoning, but the reasoning is incomplete (e.g. it contains unsubstantiated claims).

3: A strength or weakness is identified and supported with correct and complete quantitative reasoning.
Scoring: Habit of Mind to Seek out and Report Quantitative Information

“5. Does the graph help interpret the numerical information found in the text? Explain your thoughts.”

Was used to measure 1) a student’s habit of mind to check the numerical information in the text with the numerical information being presented graphically and 2) a student’s habit of mind to critically evaluate graphical information within an authentic context.
QLAR

• Rubric based on the Quantitative Literacy Assessment Rubric (QLAR) [Madison, Boersma, Diefenderfer, Dingman], *Numeracy*, Volume 4, Issue 2, Article 8.
Uses

• Administered as a pre/post QL assessment for a single general education mathematics class. (three classes, two instructors, two academic level of students)

• Pre/post assessment problematic [different articles, single course, etc.]
Results

No statistically significant gains in habits of mind [as measured by each question]

2. What was the main point(s) of the article?

4. Were there any particular strengths or weaknesses in how these facts were reported?
